Exp 7 Zoho Creator API Integration

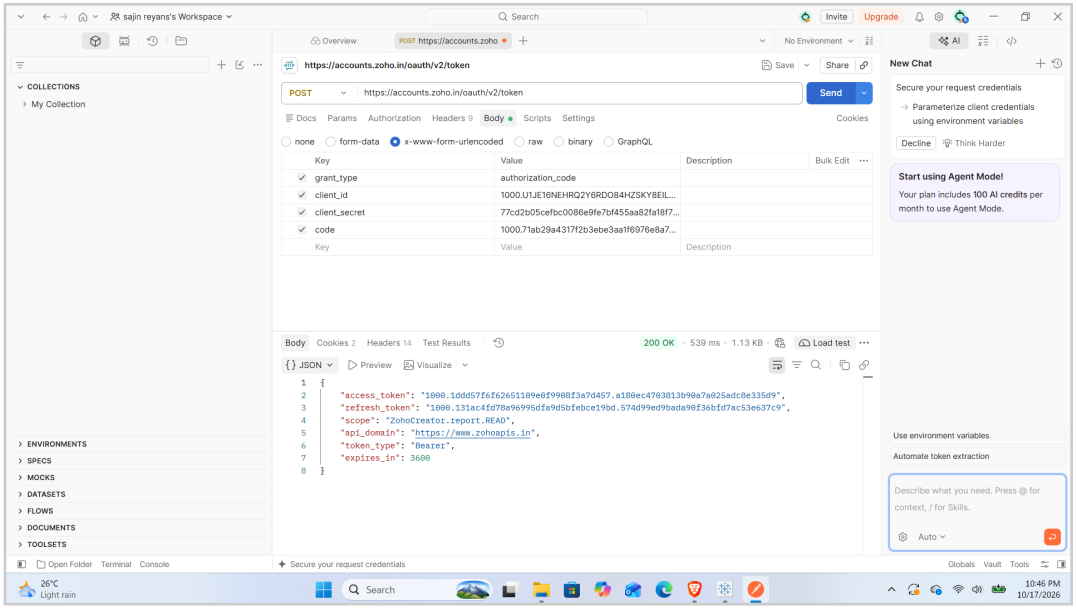

Aim:

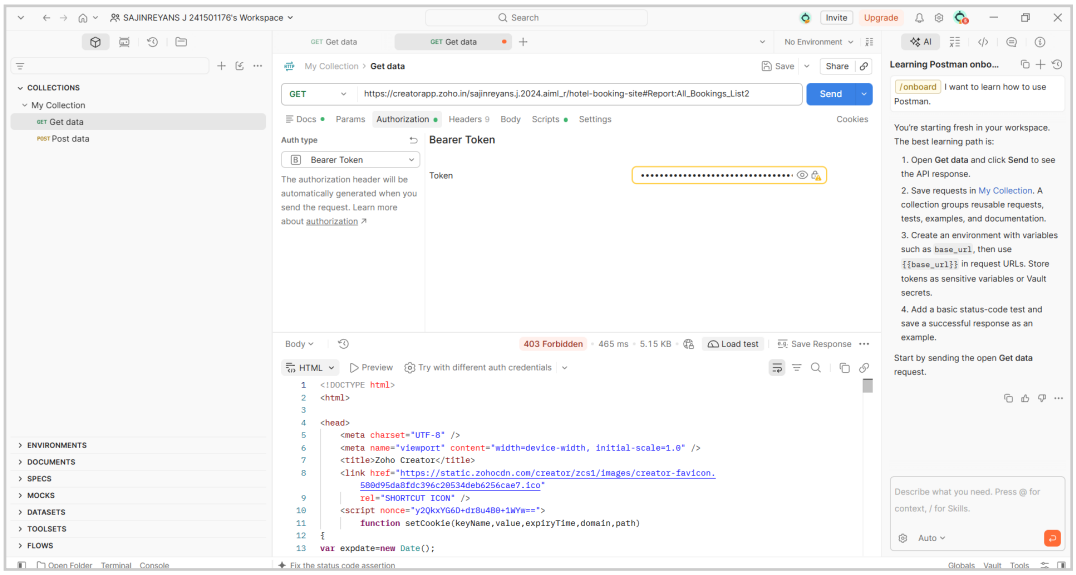

To study OAuth authentication and test a GET request to retrieve hotel booking records from Zoho Creator using Postman.

Procedure:

1. Open the Zoho API Console.
2. Select Self Client and configure the ZohoCreator.report.READ scope.
3. Generate an authorization code.
4. Exchange the authorization code for an access token using a POST request in Postman.
5. Create a GET request using the Creator endpoint and report link name All_Bookings_List2.
6. Select Bearer Token authorization and enter the access token.
7. Send the request and observe the response.

Result:

OAuth token generation was completed successfully (200 OK) and the GET request was sent with Bearer Token authorization. Successful retrieval of records was not verified because the GET request returned 403 Forbidden.
