**Experiment 8 — User Management and Role-Based Access Control**

**Aim**

To study user management and role-based access control in Zoho Creator for a hotel room booking and front-office management system.

**Theory**

Role-Based Access Control (RBAC) assigns permissions to users according to their roles. It helps protect confidential guest information and ensures that users can access only the features they need.

The proposed roles are:

| Role | Responsibilities |
|---|---|
| Admin | Manage application settings, users, permissions and all hotel bookings. |
| Front Desk Staff | View, create and process hotel bookings, and update check-in and check-out details according to assigned permissions. |
| Branch Manager | Review hotel bookings and reports permitted for their branch. |

**Procedure**

1. Open the Hotel Room Booking & Front Office Management application settings in Zoho Creator.
2. Locate the Users, Permissions or Roles section.
3. Review the available roles and permission options.
4. Configure or inspect permissions for the required roles, depending on account access.
5. Verify access using the available user-management features.

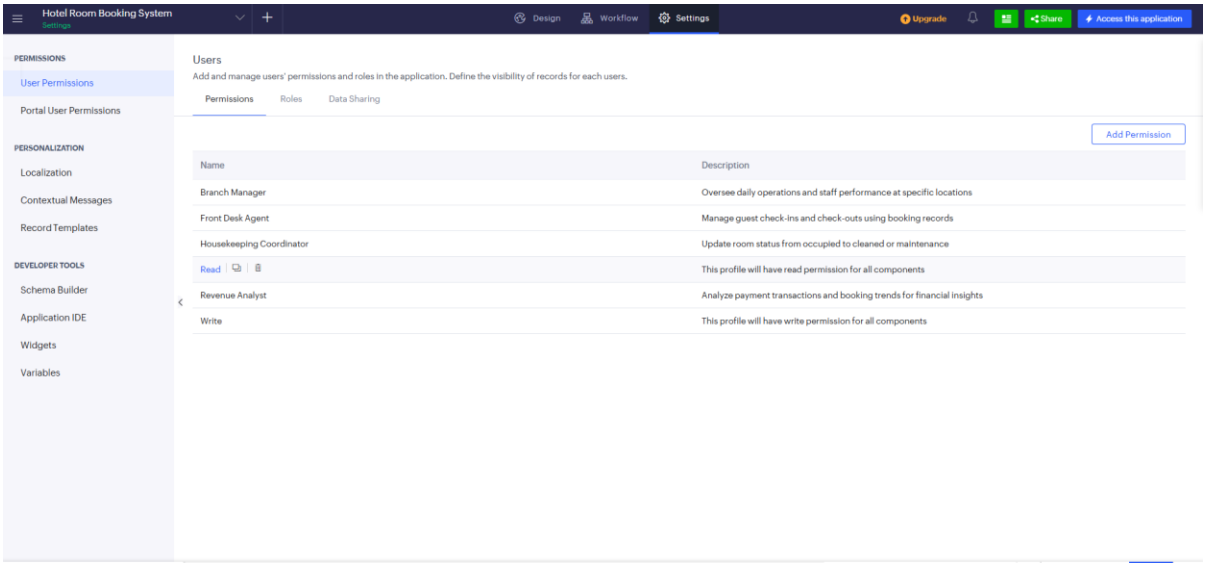

*Figure 4: Permissions tab listing the available permission sets and their descriptions*

## Result

The concepts of user management and role-based access control were studied for the Hotel Room Booking & Front Office Management system.
