## Experiment 11 — Application Deployment and Migration

### Aim

To study the deployment and migration of applications developed using Zoho Creator for a Hotel Room Booking & Front Office Management system.

### Theory

Application deployment is the process of making an application available to its intended users. Migration involves moving an application or its components between environments or accounts.

### Deployment Process

1. Develop the Hotel Room Booking & Front Office Management application in the development environment.
2. Test forms, reports, workflows and permissions.
3. Identify and fix errors in booking forms, reports and workflows.
4. Prepare the application for release.
5. Deploy or publish the application using the supported Zoho Creator options.
6. Verify that the application works correctly in the target environment.
7. Monitor the deployed application to ensure that bookings, reports and workflows function properly.

### Migration Considerations

- Application components must be compatible with the target environment.
- Hotel booking data may require separate migration or validation.
- Connections and integration settings may need reconfiguration.
- User permissions must be checked to protect guest information.
- Backups should be maintained before significant changes.

### Example

The Hotel Room Booking & Front Office Management system may be developed and tested in a development environment before being released to hotel administrators, front desk staff and branch managers. The application can then be deployed using the supported Zoho Creator options, with booking records, reports, workflows and user permissions verified in the target environment.

**Benefits**

- Controlled releases.
- Easier testing before production.
- Reduced deployment errors.
- Better maintenance and version management.

**Result**

The concepts and steps involved in application deployment and migration in Zoho Creator were studied for the Hotel Room Booking & Front Office Management system.
