Experiment 12 — Security and Governance in Zoho Creator

Aim

To study security mechanisms and governance practices used to protect applications and data in Zoho Creator.

Theory

Security protects application data and prevents unauthorized access. Governance establishes rules and procedures for managing application development, access, changes, and compliance.

Security Measures

1. **Authentication:** Verifies the identity of users accessing the Hotel Room Booking & Front Office Management application.
2. **Authorization:** Controls the actions users can perform, such as creating, viewing, updating, or deleting hotel bookings.
3. **Role-based permissions:** Assigns access based on job responsibilities, such as Admin, Front Desk Staff, and Branch Manager.
4. **Data protection:** Prevents unauthorized disclosure of confidential guest information, including names, email addresses, phone numbers, photographs, and identity proof documents.
5. **API security:** Uses OAuth tokens and appropriate scopes for secure API access to booking records and application data.
6. **Secure credential handling:** Keeps passwords, API tokens, and other confidential credentials private.
7. **Audit and monitoring:** Reviews relevant user activity, booking changes, and application modifications where supported.
8. **Backup and recovery:** Helps restore booking records and application data after accidental loss or failure.

Governance Practices

- Define application ownership and responsibilities.
- Follow naming conventions and documentation standards for forms, reports, and workflows.
- Review user permissions periodically.
- Test changes to booking forms, reports, and workflows before deployment.
- Maintain backups and change records.
- Follow applicable data protection policies when handling guest information.

Application to the Hotel Booking System

The Hotel Room Booking & Front Office Management application stores guest names, email addresses, phone numbers, identity proof documents, booking details, and other personal

information. Only authorized users should access this information according to their assigned responsibilities. Proper authentication, role-based permissions, secure credential handling, and backup practices help protect guest data and maintain the security and reliability of the application.

Result

Security principles and governance practices for Zoho Creator applications were studied for the Hotel Room Booking & Front Office Management system.
