Experiment 9 — AI and Analytics Using Zia

Aim

To explore Zia AI capabilities and analytics features in Zoho Creator for analysing loan application data.

Theory

Zia is Zoho's AI assistant and intelligence technology. Depending on the product, plan, and account configuration, it can provide AI-assisted insights and other intelligent features.

For a loan application system, useful analytics include:

- Number of applications by loan type.
- Distribution of applications by status.
- Total requested loan amount.
- Comparison of applications across branches.

Ordinary reports and charts are useful analytics, but they should not automatically be described as AI-generated results.

Procedure

1. **Open the Application:** Open the loan application system (e.g., Bank Loan Management System) in Zoho Creator.
2. **Inspect AI Features:** Inspect the available Zia or AI features from the dashboard/home screen (such as the prompt "What can I help you build today?" or application creation assistants).
3. **Navigate to Reports:** Open the reports section of the application.
4. **Identify Fields:** Identify available fields such as loan type, application status, and requested amount.
5. **Review Analytics:** Review or create charts, summaries, and metrics dashboards (such as total loan amounts, averages, and advanced loan application reports) if the account permits.
6. **Record Findings:** Record which AI and reporting features are available in your account.

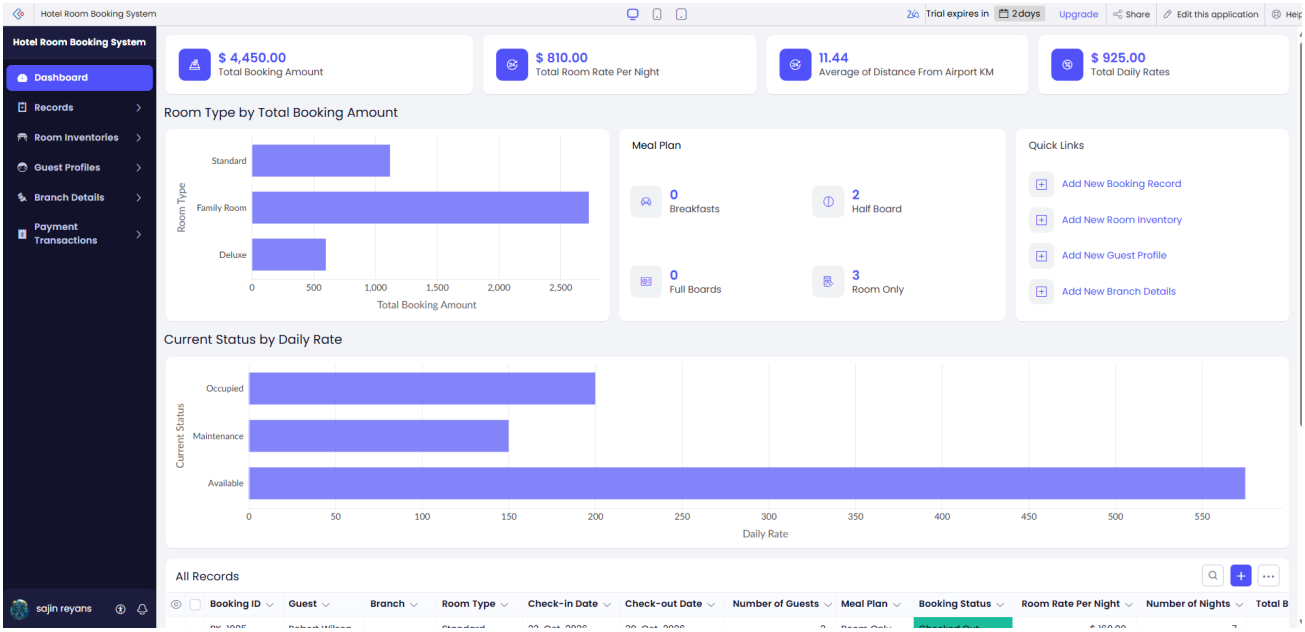

Figure 3: Application dashboard showing summary metrics, charts, meal plan summary and quick links

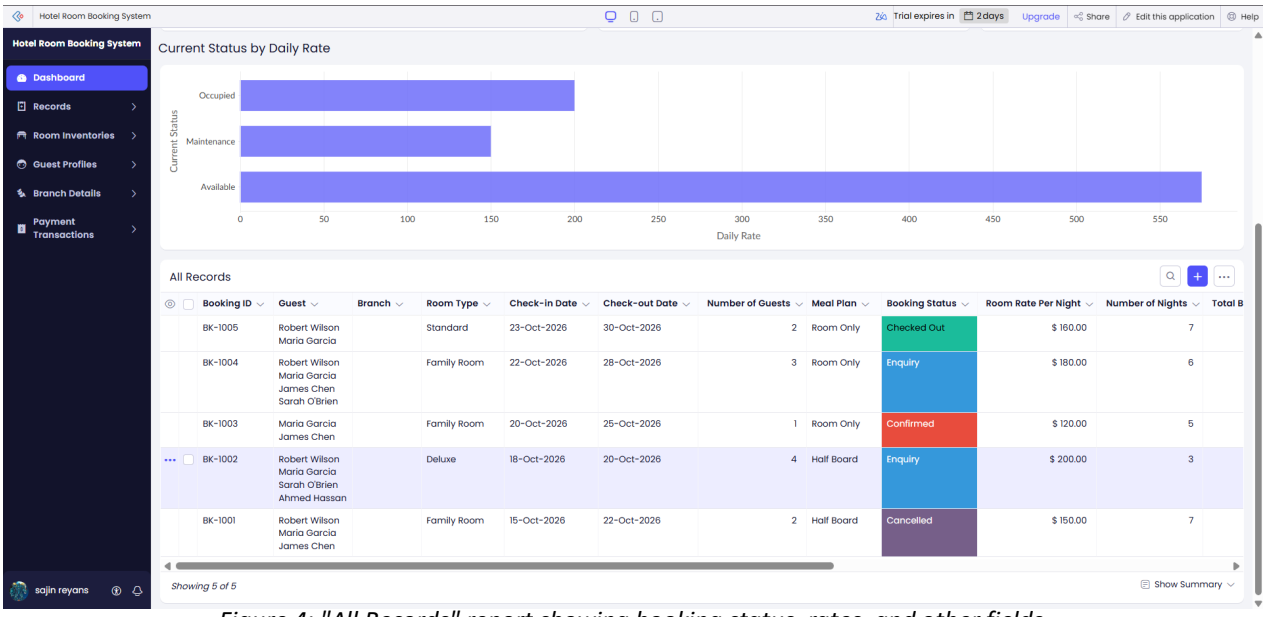

Figure 4: "All Records" report showing booking status, rates, and other fields

Result

Zia and the available analytics features were successfully explored for potential use in loan application analysis.
